RATIONALE
The pervasive nature of information systems and information technology (IS/IT) now influences most operational and managerial facets of modern organisations. The task for IS/IT managers is to learn and apply new approaches of planning, designing, and implementing information systems that meet corporate goals and objectives. Project management is an essential management process that can make the difference between an information system project's failure or success.

SYNOPSIS
This course applies the nine project management knowledge areas - project integration, scope, time, cost, quality, human resources, communications, risk and procurement management, across the project management lifecycle of initiation, planning, executing, controlling and closing. The use of computer-based project management tools and techniques suitable for IS project management are also emphasised and form a vital part of the student's skills and knowledge portfolio.

OBJECTIVES
The course objectives define the student learning outcomes for a course. On successful completion of this course, students should be able to:

1. understand the genesis of project management and its importance to improving the success of information technology projects
2. understand the triple constraint of project management: scope, time, cost
3. describe project management knowledge areas and process groups
4. understand the project life cycle: initiation, planning, executing, controlling and closing
5. demonstrate knowledge of project management terms and techniques such as: project selection methods; work breakdown structures; network diagrams, critical path analysis, and critical chain scheduling; cost estimates; earned value management; motivation theory and team building

6. apply project management software to help plan and manage information technology projects.
