Academic group: FOSCI
Academic org: FOS003
Student contribution band: 2
ASCED code: 010101

STAFFING
Moderator: Dmitry Strunin

REQUISITES
Pre-requisite: MAT2100 and MAT3103

OTHER REQUISITES
Recommended prior studies: MAT3104, MAT3105 and MAT3106

RATIONALE
Most physical situations and complex systems of interest in the world around us have an enormous number of fine details which are of little concern in many situations. The practical equations which scientists deal with are simplifications of the "true" but intractable or overly-complicated equations that describe all the fine detail. Just one example is the derivation of a numerical model for simulation. The process of creating simple model approximations for otherwise intractably detailed dynamical descriptions, sometimes called dimensional reduction, is addressed in this Course.

SYNOPSIS
This course flexibly combines aspects of modern dynamical systems theory with numerical techniques, fluid dynamics and other application areas. We develop how to derive relatively simple dynamical models in the application of the techniques to important classes of applications. The principles of the modelling process that are developed apply universally to any evolving system. The triple aim is to explore: algebraic techniques; general modelling principles; and application areas. This course is normally offered only in even years. Contact the Examiner to study this course by distance education.

OBJECTIVES
On completion of this course students will be able to:

1. discuss how separation of time scales forms a basis of modelling;
2. construct slow and manifold models of dynamics with the aid of computer algebra;
3. explore bifurcation scenarios;
4. use normal forms to understand modelling transformations;
5. understand large spatial scale, slowly varying approximations;
6. use the techniques in applications such as fluid flows, beam and shell theory, population
dynamics, queueing theory, stochastic systems, and numerical discretisations.

**TOPICS**

1.1. a rational theory of modelling is exponential collapse; centre manifold theory ensures fidelity; existence, relevance and approximation; computer algebra handles the details; slow space variations—dispersion in a channel; structural stability; lubrication models of thin fluid films; cross-sectional averaging is unsound; inertial dynamics in thin fluid films; bands of critical modes—convection; competing small effects should be independent; the slow manifold is central, beam models, quasi-geostrophic approximation; initial conditions are long-lasting; normal forms show the way; enforcing some surprises; stochastic dynamical systems possess noise induced drift; two layer ocean dynamics; slice domains into finite elements; high order consistent approximations; maintain accuracy with moving meshes; boundary conditions are straightforward; multi-dimensional discretisations; initial conditions are subtle; two-scale modelling and the Ginzburg–Landau equation; the same paradigm serves numerical and analytic models.

**TEXT and MATERIALS required to be PURCHASED or ACCESSED**

All textbooks and materials are available for purchase from USQ BOOKSHOP (unless otherwise stated). Orders may be placed via secure internet, free fax 1800642453, phone 07 46312742 (within Australia), or mail. Overseas students should fax +61 7 46311743, or phone +61 7 46312742. For costs, further details, and internet ordering, use the 'Textbook Search' facility at http://bookshop.usq.edu.au click 'Semester', then enter your 'Course Code' (no spaces).

**REFERENCE MATERIALS**

Reference materials are materials that, if accessed by students, may improve their knowledge and understanding of the material in the course and enrich their learning experience.

**IMPORTANT ASSESSMENT INFORMATION**

1 Attendance requirements:
   It is the students' responsibility to attend and participate appropriately in all activities
   (such as lectures, tutorials, laboratories and practical work) scheduled for them, and to
   study all material provided to them or required to be accessed by them to maximise their
   chance of meeting the objectives of the course and to be informed of course-related
   activities and administration.

2 Requirements for students to complete each assessment item satisfactorily:
   To satisfactorily complete an assessment items, a student must obtain achieve at least 50%
   of the marks or a grade of at least C-. (Depending upon the requirements in Statement 4
   below, students may not have to satisfactorily complete each assessment item to receive
   a passing grade in this course.)

3 Penalties for late submission of required work:
   If students submit assignments after the due date without prior approval then a penalty of
   20% of the total marks gained by the student for the assignment will apply for each working
   day late.

4 Requirements for student to be awarded a passing grade in the course:
   To be assured of receiving a passing grade a student must achieve at least 30% in all of
   the weighted assessment items, achieve a total mark of at least 50% in Part A and 50%
   in Part B of the examination, and at least 50% of the available weighted marks for the
   summative assessment items.

5 Method used to combine assessment results to attain final grade:
   The final grades for students will be assigned on the basis of the aggregate of the weighted
   marks/grades obtained for each of the summative assessment items in the course.

6 Examination information:
To be advised

7 Examination period when Deferred/Supplementary examinations will be held:
   To be advised

8 University Regulations:
   Students should read USQ Regulations 5.1 Definitions, 5.6 Assessment, and 5.10 Academic
   Misconduct for further information and to avoid actions which might contravene University
   Regulations. These regulations can be found at
   http://www.usq.edu.au/corporateservices/calendar/part5.htm or in the current USQ
   Handbook.

ASSESSMENT NOTES

9 The due date for an assignment is the date by which a student must despatch the assignment
   to the USQ. The onus is on the student to provide proof of the despatch date, if requested
   by the Examiner.

10 Students may be required to provide a copy of assignments submitted for assessment
    purposes. Such copies should be dispatched to the USQ within 24 hours of receipt of a
    request to do so.
